

PROJECT MATCHO

Existing platforms in sports:

Cricket-focused apps and platforms

- ESPNcricinfo — live scores, commentary, news, stats, and match analysis
- ICC Cricket — official international cricket updates and tournament coverage
- BCCI.tv — official Indian cricket board platform for matches, highlights, and updates
- MyKhel — cricket and broader sports coverage with scores and news.
- Cricket.com — live scores, match coverage, and analysis;
- Cricket Exchange — live score updates and player/stat graphics.

Multi-sport score apps

- SofaScore — covers cricket plus football, tennis, basketball, and other sports.
- 365Scores — live scores, notifications, and sports news across many sports
- Sky Sports — broad sports coverage, including cricket
- BeSoccer — mainly football, but part of the broader live-sports app category.

HOW MATCHO APP SHOULD BE UPDATING LIVESCORES:

- The match event is captured at the venue by scorers, cameras, or sensors.
- That data goes to a sports data provider through an API feed.
- The backend receives the data and stores it in a fast database or cache.
- The mobile app reads the updated score and shows it to users.
- Important events like wickets or goals can also trigger push notifications.

ARCHITECTURE DIAGRAM:

KEY FEATURES :

- Live score and commentary.
- Player and team stats.
- Match timeline and key events.
- Push alerts with customization.
- Fixtures, schedules, and rankings.
- Broadcast/streaming details.
- Offline or low-data mode for weak networks.
